

**AMENDMENTS TO THE CLAIMS**

**This listing of claims will replace all prior versions and listings of claims in the application:**

**LISTING OF CLAIMS:**

1. (currently amended): A method for synthesizing speech with an apparatus comprising a sound source for generating a frequency signal, a vocal tract filter for filtering said frequency signal to generate a speech waveform signal, said filter having characteristics corresponding to a linear predictive coefficient calculated from respective phonemes in a phoneme series, comprising the steps of:

dividing each of said phonemes into a ~~plurality of~~ N frames, each of said N frames having a predetermined time length;

summing squares of speech samples in one of said plurality of frames for each frame as a frame power value;

standardizing frame power values at head and tail frames in one phoneme to predetermined values, respectively, to obtain a frame power value of an n-th frame, wherein ( $1 < n < N$ );

summing squares of signal levels of ~~a~~ an n-th frame in said frequency signal to obtain a frame power correction value for the n-th frame; and

providing a speech envelope signal by means of a function having variables of said ~~standardized frame power values~~ value of the n-th frame and said frame power correction value

for the n-th frame, and adjusting an amplitude level of said speech waveform signal as a function of the speech envelope signal.

2. (original): A method according to claim 1, further comprising:

providing power frequency characteristics based on said linear predictive coefficient corresponding to said n-th frame,

calculating an average value of power values sampled from said power frequency characteristics at a predetermined frequency interval as a mean frame power value,

calculating a speech waveform signal by means of a function having variables of said standardized frame power value, said frame power correction value and said mean frame power value, and

adjusting an amplitude of said speech waveform signal as a function of said speech envelope signal.

3. (original): A method according to claim 2, wherein said function is expressed;

$$V_m = \sqrt{P_n / (G_s G_f)}$$

wherein  $P_n$  is said standardized frame power value,  $G_s$  is said frame power correction value, and  $G_f$  is said mean frame power value.

AMENDMENT UNDER 37 C.F.R. § 1.111  
APPLICATION NO.: 09/684,331

Attorney Docket No.: Q61111

42

4. (original): A method according to claim 1, wherein said frequency signal includes an impulse signal carrying a voiced sound and a noise signal carrying an unvoiced sound.
